
Usage

This repository provides some testing environment for NoSQL database systems, so that you can test how the query languages work.

Just use the scripts with `./run_<database>.sh` in this directory. The scripts will start a docker container with the database system, then it will create some test data, and then it will enter a shell where you can write some queries. When you are done you can kill the containers with `docker kill <database>; docker rm <database>`

Neo4J

You can Create the container and enter the Cypher-Shell with `./run_neo4j.sh`. There you can run cypher queries, some example queries are described in the next section. When you are finished you can exit with `:exit`. The database is created with the following nodes and connections:

```
1 CREATE
2 (n1:Node {name:1}), (n2:Node {name:2}), (n3:Node {name:3}), (n4:Node {
   name:4}),
3 (n5:Node {name:5}), (n6:Node {name:6}), (n7:Node {name:7}), (n8:Node {
   name:8}),
4
5 (n1)-[:LINK]->(n2), (n2)-[:LINK]->(n3), (n3)-[:LINK]->(n1), (n3)-[:LINK
   ]->(n4),
6 (n3)-[:LINK]->(n5), (n4)-[:LINK]->(n5), (n4)-[:LINK]->(n7), (n5)-[:LINK
   ]->(n6),
7 (n6)-[:LINK]->(n4), (n6)-[:LINK]->(n7), (n6)-[:LINK]->(n8), (n7)-[:LINK
   ]->(n8);
```

Queries Returns nodes a, b, c matching this connection pattern:

```
1 MATCH (a)-->(b)-->(c)<--(a)
2 RETURN a.name, b.name, c.name;
```

Return nodes and lengths for paths between nodes 1 and 7 with max length of 4:

```
1 MATCH p=(a)-[*1..4]-(b)
2 WHERE a.name = 1 AND b.name = 7
3 RETURN nodes(p), length(p);
```

Return shortest Path between 1 and 7:

```
1 MATCH p=shortestPath((a)-[*..4]-(b))
2 WHERE a.name = 1 AND b.name = 7
3 RETURN nodes(p);
```

MongoDB

You can Create the container and enter mongosh with `./run_mongo.sh` There you can execute queries, some example queries are described in the next section. When you are finished you can exit with `exit()` or `quit()`. The Database contains json files with the following format:

```
1 {
2   "city":"Tokyo",
3   "population":13960000,
4   "continent":"Asia",
5   "country":"Japan",
6   "known_for":["technology", "finance", "anime culture"],
7   "coordinates":{"lat":35.6762, "long":139.6503},
8   "timezone":"Asia/Tokyo"
9 }
```

Note: the city data was generated with ChatGPT, and I haven't checked the data. Hallucination levels may range from 1 beer to 5 tabs of ACID. But ACID is good for databases, so I hope it's OK.

Queries

description	query
return all cities	<code>db.cities.find()</code>
Find in Europe (only print city name)	<code>db.cities.find({ continent : 'Europe'}, { _id:0, city : 1})</code>
Return cities known for history or government	<code>db.cities.find({known_for: {\$in : ['history', 'government']}}, { _id : 0})</code>
